

Example #1

A converging lens has a focal length of 40 mm. A 10-mm tall object is placed 60 mm in front of it.

(a) Find the distance to the image.

(b) Find the height of the image

(c) Find the magnification of the image

(d) Describe the image (*i.e.* real or virtual? upright or inverted?)

Example #1

A converging lens has a focal length of 40 mm. A 10-mm tall object is placed 60 mm in front of it.

(a) Find the distance to the image.

(b) Find the height of the image

(c) Find the magnification of the image

(d) Describe the image (*i.e.* real or virtual? upright or inverted?)

Task #1

A converging lens has a focal length of 40 mm. A 10-mm tall object is placed 60 mm in front of it.

- (a) Find the distance to the image.
- (b) Find the height of the image
- (c) Find the magnification of the image
- (d) Describe the image (*i.e.* real or virtual? upright or inverted?)

Task #1

A converging lens has a focal length of 40 mm. A 10-mm tall object is placed 60 mm in front of it.

- (a) Find the distance to the image.
- (b) Find the height of the image
- (c) Find the magnification of the image
- (d) Describe the image (*i.e.* real or virtual? upright or inverted?)

Task #1

A converging lens has a focal length of 40 mm. A 10-mm tall object is placed 60 mm in front of it.

- (a) Find the distance to the image.
- (b) Find the height of the image
- (c) Find the magnification of the image
- (d) Describe the image (*i.e.* real or virtual? upright or inverted?)
