Name: Period:

Mon, Mar 2

Warmup

1. Of the three things you adjusted in the lab last week, what was the only thing that affected the period of the pendulum?

2. Take a look at the equation for period (T) of a pendulum: $T_P = 2\pi\sqrt{\frac{\ell}{g}}..$ Other than your answer for #1 what else affects the period of the pendulum? Why didn't we see that in the lab?

3. Pendulum A and pendulum B are identical, except that pendulum A has twice as much amplitude.

   (a) Which pendulum has the longer period? How do you know?

   (b) Which pendulum has the faster top speed? How do you know?
