## Kinematics #1

1. A car is initially travelling at 21 m/s. If it travels 615 m in 9.2 s, what is its acceleration?

2. A cyclist is going up a hill and slows down at a rate of  $-5.8 \text{ m/s}^2$  over 10 m. At the end the cyclist is traveling at 2.3 m/s. What was the speed of the bicycle before it got to the hill?

- 3. A train starting from rest accelerates for 58 s at a rate of 0.42 m/s².
  - (a) What is the train's final velocity?

(b) How far would the train have traveled in that time?
