

Name:

Period:

Wed, Apr 29 (Pd 6) / Thu, Apr 30 (Pd 1, 4)

Warmup

In 1929, the astronomer Edwin Hubble, discovered that when he observed galaxies that were far away, they appeared redder than they should. He used this observation and the Doppler Effect to prove that galaxies are moving in space. **In 2-3 sentences, *explain*** whether the galaxies are moving away from us or toward us *and how you know*. For reference, redder objects have a lower frequency of light, and bluer objects a higher frequency.
