

Name: _____ Period: _____

Tue, Sept 8

Warmup

1. What is the acceleration of objects in free fall?
2. Ignoring air resistance, what is true about heavy and light objects and how they fall?
3. Explain in a couple sentences what happens to a ball thrown straight up into the air as it is moving up, as it reaches the top of its motion, and as its moving down

4. An object is thrown straight up into the air. Consider which way the velocity and acceleration vectors point at each of these moments in time:

(a) On the way up,

an object's *velocity* is
☐ + ☐ - ☐ zero

an object's *acceleration* is
☐ + ☐ - ☐ zero

(b) At the top of its motion,

an object's *velocity* is
☐ + ☐ - ☐ zero

an object's *acceleration* is
☐ + ☐ - ☐ zero

(c) On the way down,

an object's *velocity* is
☐ + ☐ - ☐ zero

an object's *acceleration* is
☐ + ☐ - ☐ zero
