

Name: _____

Period: _____

Mon, Sept 28

Warmup

1. When solving a projectile motion problem, what is the only value that you can assume is the same for both the x - and y -directions? Why is that the case?
2. Consider a projectile that has an initial resultant velocity of 7 m/s at an angle 71° above the ground.
 - (a) Label the diagram and make a T-Chart

- (b) Draw a triangle and calculate the x - and y - components of the initial velocity. Add these to your T-chart
- (c) Calculate how much time the projectile is in the air.
