

Fri, Oct 2

Warmup

Consider two identical objects. Object A is dropped from a height of 1.2 m. Object B is launched horizontally (at 7 m/s) from the same height. You may assume that there is no air resistance.

(a) Make a T-chart for both objects.

Ball A		Ball B	
<i>x</i> -direction	<i>y</i> -direction	<i>x</i> -direction	<i>y</i> -direction

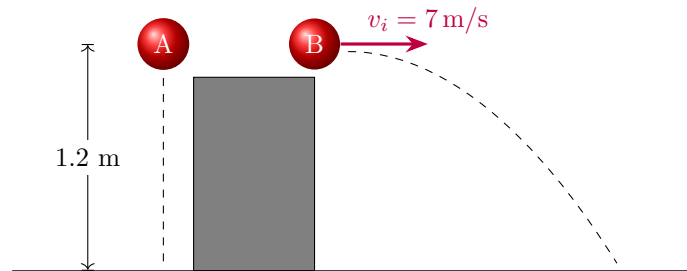

(b) Which object will hit the ground first? (*You don't need to actually calculate anything; just look at your T-charts*)

(c) Which object will be traveling faster when it hits the ground?
